

Sa_AD Memo_Muscle Structure

Character Technical Profile: Sa Cha (Revised)

Art Direction & Clinical Reality Memo

 

Jaw, constant bite, gritty through teeth

1. Clinical Overview: The Rebound Asset

Sa's physical state is a violent transition from **Institutional Rot** to **Pharmacological Overclocking**. He is 28–29 years old, but his body carries two distinct eras of trauma: five years of sedentary "wasting" in an asylum followed by one year of explosive, drug-fueled kinetic activity.

- **The Asylum Legacy:** Between ages 22 and 27, Sa suffered from muscle atrophy, Vitamin D deficiency, and "confinement posture." His frame is currently a "rebound" physique—forced back into service by Ipha-c's protocols.
 - **The Artificial Heart (The Governor):** Due to Abyss City's endemic heart disease, Sa's chest contains a synthetic pump. It is the only reason he survives the **Revs/Synapress Deadlock**. While a biological heart would burst under the pressure of the drugs, the artificial structure holds—but it creates a metallic, high-frequency "thrum" in his chest that replaces a heartbeat.
 - **Attrition:** He is a "Glass Cannon." His current power is high, but his foundation (bones/organs) is brittle from years of neglect.
-

2. Estimated Anatomical Metrics

Height: 172cm (5'7" - 5'8")

- **Art Logic:** Sa is "compact." He isn't a towering soldier; he is a pitbull. His height gives him a lower center of gravity, making his movements look twitchy, fast, and grounded. He feels "smaller" in a room until he starts moving.

Body Fat Proportion: 10% – 12% (Waxy Lean)

- **Visual Cues:** He has the "shred" of a stimulant user, but because of the **Synapress** (the ballast water), he often suffers from slight "edema" (water retention).
- **Texture:** His skin has an "Asylum Pallor"—translucent, sallow, and prone to bruising. You can see the veins clearly, but the skin looks "unhealthy," like he hasn't seen natural sunlight in a decade.

Muscle Structure: "Rebound" Hypertrophy

- **Type:** Fast-twitch, high-tension.
- **Visual Logic:** His muscles look "new." They are dense and ropey, built rapidly over the last year through chemical assistance and high-stress combat.
- **Key Detail:** Look for **stretch marks** around the shoulders or lats—visual evidence of his body being forced to grow back too quickly after the asylum wasting.
- **The "Drug Neck":** His neck and jaw muscles are hyper-tense (trismus), making him look "coiled" even when he's sitting still.

Bone Density: 0.9 – 1.1 g/cm² (Fragile-High)

- **The Flaw:** Despite his muscle mass, his bones are his "Achilles' heel." Five years without weight-bearing exercise in the asylum left him with **borderline osteopenia**.
- **Visual Logic:** His joints (wrists, ankles) look slightly "thin" compared to the muscle.
- **Narrative Weight:** This is why the **Mouth Audit** is so dangerous. If he bites down during a "Revs" seizure, his dense muscles could literally snap his own jaw or shatter his teeth because his bones haven't caught up to his strength.

3. In-Plot Hardware & Maintenance

- **The Chest Scar:** A vertical, surgical "zipper" scar down the center of his sternum where the artificial heart was installed. It is slightly keloid (raised) and discolored.
- **The Maintenance Cycle:** He is currently 11 months into his cycle. The artificial heart is starting to "whine." You can hear a faint mechanical click in a quiet room.
- **The Heart-Drug Interface:** When Sa takes the Revs, the artificial heart doesn't "speed up" like a human heart—it **vibrates**. It creates a rhythmic buzzing that Sa feels in his teeth.

4. Art Direction Note: The "Used" Weapon

Sa should not look like a "hero." He should look like a switchblade that was found in a gutter and sharpened until the blade is dangerously thin.

- **The Eyes:** Ruptured capillaries are common. His eyes should often look "bloodshot" or "angry" due to the artificial heart forcing high-pressure blood through his fragile ocular vessels.
- **The Skin:** "Medicalized." He smells like a mix of ozone, synthetic lubricant (from the heart), and bitter chemicals.
