

# How to move plugins to project instead of the engine

UE5 plugin best practice

Copy the plugin folder from your "YourEngineLocation/Engine/Plugins/Marketplace" folder to your "/MyUnrealProject/Plugins" folder. This adds the plugin to your project instead of the engine itself, which will

1. prevent plugin auto-updating.
2. easier syncing on git, especially if you want to modify plugin

Once you do this it is also a good idea to delete your marketplace version, otherwise you'll have 2 copies which can cause issues.
