

Package Game

Step 1: Tell the Engine Which Map to Load (CRITICAL)

If you don't do this, the packaged game won't know where to start.

1. At the top of the editor, click **Edit** -> **Project Settings**.
2. On the left panel, look under the **Project** section and click **Maps & Modes**.
3. Look at the **Default Maps** section.
4. Change **Game Default Map** to the exact level (map) you want the player to see when they open the demo (e.g., your Main Menu or World Map).
5. *(Optional but recommended)* Change the **Editor Startup Map** to the same thing, just to be safe.

Step 2: Choose Your Build Type

You need to decide if this is a test build or a final polished build.

1. Look at the top toolbar in the Unreal Editor and click the **Platforms** dropdown (it looks like a little monitor/laptop icon).
2. Hover over **Windows** (or Mac, if you are on an Apple computer).
3. Look for **Build Configuration**:
 - Select **Development** if you want to be able to press the  key to open the command console and check for errors while playing. (Best for your first demo).
 - Select **Shipping** if this is the absolute final version going to players. It hides the console and runs slightly faster.

Step 3: Pack It!

1. Click that **Platforms** dropdown again.
2. Hover over **Windows**.

3. Click **Package Project**.
4. A window will pop up asking *where* you want to save it.
5. Create a brand new, empty folder on your Desktop (call it MyGame_Demo) and select that folder.
6. Look at the bottom right of your Unreal screen. You will see a little pop-up saying **Packaging Project....**
7. **Hands off the keyboard.** Let it bake. This can take anywhere from 2 minutes to 20 minutes depending on your PC and the size of your game.
