image-20260515-221717.png

Purpose: Hides background loading. Acts as a full-screen visual buffer.

Key Variable: PureBlackScreen? (Boolean)

- **Instance Editable:** Check this.
- **Expose on Spawn:** Check this.

Logic Pipelines:

- **If False (Default):** Runs complex material shader. Timing is material-driven.
- **If True:** Bypasses material. Turns on solid black image layer. Plays UMG fade animation.

Execution & Timing Flow:

1. **Start:** Widget spawns. Branch checks variable.
2. **Fade In:** Animation starts. Screen goes to 100% black.
3. **Wait:** Delay node waits for fade-in to finish.
4. **Trigger Event:** Fires Call On Screen Covered Event. (*Game safely spawns/loads behind black screen*).
5. **Fade Out:** Delay node waits for hold and fade-out to finish. Screen clears.
6. **Cleanup:** Widget sets self to Collapsed. UI resources are freed.
