

大渊城GDP

In a submarine metropolis, the most fundamental rule of economics is that **existence is a utility**. On the surface, the atmosphere and the sun are free; in The Sunk, every breath, every degree of heat, and every drop of clean water must be manufactured by a reactor and distributed through a pipe.

Because of this, the city operates on a brutal, hyper-capitalist model where biology itself is monetized.

Here is how the macro-economics of The Sunk function, and how they crush the average citizen:

The Currency and GDP

The fiat currency of The Sunk isn't backed by gold; it is backed by energy. The standard unit of trade is likely the **Joule** or the **Kilowatt (kW)**, representing a fraction of the city's central reactor output.

The city's GDP is entirely industrial and resource-extractive:

- **Deep-Sea Mining:** Extraction of rare-earth metals, manganese nodules, and lithium from the ocean floor.
- **Hydro-Thermal Energy:** Harnessing volcanic vents to generate excess power, which is the lifeblood of the city.
- **Bio-Chemical Harvesting:** Farming extremophile bacteria and deep-sea flora for pharmaceuticals and synthetic proteins.
- **Data Storage:** The ocean floor provides naturally sub-zero, heavily shielded environments, making The Sunk a massive, secure server-farm for surface corporations.

The Cost of Survival

For a baseline worker, basic survival occupies roughly **75% to 85% of their total income**. There is almost no middle class. You are either a corporate administrator hoarding surplus energy, or you are living paycheck-to-paycheck just to keep your lungs full.

- **The Atmos-Tax:** You are billed daily for your oxygen consumption and CO2 scrubbing.

- **Thermal Rent:** The ocean outside is freezing. You have to pay for ambient municipal heating in your residential block.
- **Water Reclamation:** You pay for the filtration of your own recycled waste-water.

Because of this, Sa choosing to rent a large apartment means he is bleeding himself dry. He is likely sacrificing food, heat, and equipment maintenance just to afford empty floor space.

How Much is Oxygen?

Oxygen isn't sold at a flat rate; it is tiered based on what you can afford. The city's life-support grid dynamically adjusts the air mixture in different sectors based on the residents' ability to pay.

Tier	O2 Level	Location	Side Effects
Premium	21% (Surface Standard)	Corporate Spires	Crisp air, high energy, peak cognitive function.
Standard	19.5%	Mid-level Residential	Noticeable staleness, minor fatigue after exercise.
Minimum	18% (Legal Floor)	Industrial/Lower Decks	Chronic brain-fog, lethargy, persistent headaches.

If you default on your Atmos-Tax, they don't immediately suffocate you. Instead, the ventilation in your specific apartment is throttled down to the 18% legal minimum, and the CO2 scrubbers run at half-capacity. It makes you too tired to fight back, which is exactly how the administration likes the lower classes.

The "Homeless" Issue

In a pressurized, climate-controlled environment, you cannot have people sleeping on the sidewalks. A body lying in a transit corridor is a tripping hazard, a bio-hazard, and an inefficient use of floor space. Homelessness is strictly criminalized.

If a citizen goes bankrupt and gets evicted, they become **"Unvented."**

1. **The Sump:** The destitute are pushed into the lowest, unmaintained maintenance decks—the Sump. These areas aren't officially zoned for living, meaning the city doesn't actively pump fresh Atmos down there. The Unvented survive on the "trickle-down" stale air that sinks from the upper decks.
2. **Indentured Reclamation:** If the city security forces catch you loitering or sleeping in a public sector, you are arrested for "Space Theft" and "Unauthorized Oxygen Consumption." You are immediately drafted into high-risk, low-tier labor (like exterior hull scraping or reactor maintenance) to pay off your debt to the city grid.
