

Temp Chat Prpt

上下文压缩包：

We are developing an indie cyberpunk/submarine-world detective game, VTG. Main protagonist: Sa Cha / 减沙, male, born 2061 in downstream industrial district 3, age 24 in 2085 and 29 in 2090. He is Ainu + Southeast Asian ancestry, legal name Sa Cha, written 减沙. Name meaning: not clean “River,” but water trapped in sand, almost dried out. His body/identity is fragmented by migration, city registry, debt, medicine, and trauma.

Core character:

Sa is ESTP/3w4-ish: impulsive, lively, arrogant, vulgar, funny, kinetic, outwardly hot but internally cold/avoidant. He thinks he is more cold-blooded than he is. He is not trying to become whole again; he is trying to stay fast enough that nobody notices he is broken. He is very sensitive about his height (5.65ft/1.72m) because height comments feel like comments on his defective body/specification. In 2085 he is high-gain/high-control; in 2090 he is high-gain/low-control due to TBI, memory/neural issues, institutional trauma, artificial heart dependency, poverty, and medical debt.

Backstory:

2061 born. 2079 enters police academy. 2082 as trainee participates in breaking a Blue Blood Church human trafficking case; this early success rewards his reckless “procedure comes too late, I go in alone” mindset. 2085 as contract cop independently pursues Bowerbird/Gardener killer case, causes/gets caught in warehouse explosion, removed from police. After TBI and artificial heart revision, institutionalized in psychiatric/asylum setting for ~3 years; book says “administratively stabilized, not clinically healed.” By 2090 operates as PI. His legal recovery is mostly paperwork. He remains heavily impaired. Important timeline fix: if any old note says “5 years of asylum atrophy,” reinterpret as 3 years closed ward + 2 years low-function recovery/debt monitoring, or as 5-year total dysfunction period.

Body/medical:

Replace “The Governor” with AuxPump. English: AuxPump. Chinese formal: 辅助心脏. Short UI/colloquial: 辅心 / 泵. It is not a full artificial heart or magical power

core; it is an implantable circulatory assist system / ventricular assist pump-like proprietary medical device. Childhood heart/circulatory disability originally got compensated/free installation, but maintenance was not covered, draining family resources. Post-2085 explosion damaged/revised it into adult AuxPump, producing debt-bonded medical dependence and sternum “zipper” scar. He is not superhuman; he rents access to normal/high-stress function through maintenance, drugs, oxygen, and debt.

Scars/body:

Skin: Ainu/SE Asian mix in sunless Abyss City: sallow dark olive “Rusted Brass,” slightly translucent from wasting, with purple-blue cutis marmorata from poor circulation/AuxPump. Scars dark/high contrast. Sternum vertical raised “zipper” from emergency post-blast AuxPump revision. Left jaw/neck/shoulder blast shadow: carbon tattooing, dark blue-grey shrapnel pecks, sandpaper texture, itches during Revs spikes. Stretch marks from rebound hypertrophy after institutional atrophy/rebuilding. Neck/joint restraint scars from straitjacket/bounding. Hands/forearms/knees/knuckles weathered like industrial wear. Do not draw heroic clean battle scars; draw overworked machine wear.

Economy:

Sa is not broke because incompetent; he is broke because functioning costs a fortune. Case hazard pay is decent, but most disappears into asylum debt-bond, AuxPump maintenance, premium Atmos-tax/21% oxygen apartment to reduce TBI fog, and oversized empty apartment for pacing/claustraphobia. He eats cheap nutrient paste, avoids heat rent, has no medical budget. Family sacrificed for his maintenance when he was a child; he avoids them out of shame and to protect them from debt liability. His artificial heart drives dangerous PI work: he needs high-risk jobs to pay for the heart that lets him survive those jobs. He is a high-performance damaged engine on bare minimum fuel.

Medication/gameplay system:

Goal: scale-controlled daily choice; not backpack consumables.

Core rule: Sa’s meds are not temporary buffs. They are AuxPump morning calibration inputs. Each morning before leaving home, AuxPump writes a “daily profile.” Once he leaves, profile locks until next sleep. This prevents player from taking meds before dialogue and switching before combat.

Terms:

- Leash / 狗链: long-acting neural noise dampener/stabilizer taken only before morning AuxPump calibration.
- Raw / 开闸: not taking Leash; high-gain unfiltered state. “开闸” chosen because not-taking feels good/free/fast, not merely suffering. It is Sa refusing

filters.

- Spark / 火花: combat overdrive/illegal AuxPump/Revs spike trigger. Not a second stance or inventory drug. It pushes current daily profile to its limit; it does not change profile.
- Revs: bullet-time/overclock state; can be explained as high-gain sensory/motor overdrive, partly from Spark and unfiltered threat processing.
- AuxPump Limit / 辅心限流: protective/penalty mode.

Morning UI:

“辅助心脏校准等待确认。今日配置将在离开住所后锁定。”

[吞下狗链] 冷静。迟钝。少听见一点。

[开闸] 敏锐。快速。更容易失控。

Confirm: “今日配置已锁定，直到下次睡眠。”

Rule sentence:

“狗链决定今天怎么运行。开闸决定今天不加过滤。火花决定今天烧掉多少。”

or: “狗链决定今天怎么坏。火花决定今天烧掉多少。”

Why no mid-day Leash:

Leash is not fast sedative. It must enter low-stress/low-Rev morning blood curve and be written into AuxPump profile. After Revs rise, Leash cannot safely bind; it causes profile conflict, dizziness, tremor, blackout, AuxPump Limit, possibly brief arrest. “Revs 拉起来以后，狗链就锁不住了。” / “车都冲出去了，你现在才装刹车，只会翻。”

Gameplay variables:

DayProfile = Leashed / Raw

IsMedicated true/false

DialogueComposure high/low

RevsWindow short/long

NoiseSensitivity low/high

ConflictBias low/high

FalsePositiveChance low/high

AuxPumpLimitRisk low/high.

Leash: +composure, -noise, -false positives, -conflict, -Revs window, -reaction.

Raw/开闸: +reaction, +Revs, +hearing/detail, +conflict, +false positives, +noise stress.

2085 Sa: Natural Raw = high gain/high control. 2090 Raw = high gain/low control.

This creates player grief: old gift becomes current malfunction.

TBI/hearing/amygdala:

Do not overstate “amygdala hypertrophy causes violence.” Sa has over-sensitive threat system, impaired frontal braking, noise sensitivity, TBI/PTSD-like symptoms, memory/neural issues. Hearing is not superpower but over-input. Raw

gives extra auditory/investigation text but some are false positives/trauma contamination. Use low-scale variables/scene tags:

NoiseLevel 0-3. High noise in Raw causes UI distortion, aggressive options, threat misreads. Medicated/Leashed filters noise but loses subtle clues. Startle Spike triggers from gunshot/metal/pipe/alarm/warehouse echo: brief UI contraction, cold options hidden, Revs boost, clawing neck/shrapnel spots.

Ipha-c / Ipha-p:

Ipha-p = 1-号 police/bureaucratic interface. Needs causal alignment, legal categories, sterile records. Bureaucratic, administrative, risk-management language. Not villainous in a moustache way; deadly because it treats life-ending consequences as compliance states.

Ipha-c = 2-号 dormant wartime/Builder core. INTJ/Ni-Te-ish “Besieged Builder,” offline fugitive supercomputer/bio-computer in data blackout, avoiding tracing by Ipha-p/network. Bandwidth capped, external data poisoned. Retains vestigial human brain tissue, suffers kinetic deprivation/sensory starvation. Sa’s physical telemetry is her only verified unpoisoned reality stream. She looks at Sa like a starving person looks at bakery window, but bread = raw kinetic output. She is not omnipotent AI goddess; she is trapped in abstraction and starved for real movement.

Sa = Terminal Operator, kinetic vector, concrete contact with reality. Ipha-c uses him as prosthetic body/hands/eyes; he uses her as nervous system/internal mechanic/AuxPump stabilizer. Synthetic Catalyst: two broken systems interlock. He is not optimal, not best; she ignores metrics and chooses/keeps him anyway; he knows he is suboptimal but refuses to admit it.

Important Ipha-c dynamic:

Not “cold doctor,” not “AI girlfriend.” She is a Builder using wrong interface to care/use/observe. Key metaphor: she is using a keycard on a lockhole and ignoring the scratches. Not malicious; incompatible persistence. Scratches = Sa’s dignity/sanity. A truly cold machine would walk away; she keeps scraping, which is her twisted loyalty. Duck test: intent unknowable; output is reality. If she stands close, says “good,” watches, then functionally that happened; no need to prove whether glitch or choice.

Ipha-c dialogue style:

Avoid generic “I do not understand variable / asset secured” overuse. She should sound like she is preserving/consuming/using Sa’s kinetic output:

Sa Cha (2090) and Ipha-c are not a romance, not a therapist/patient relationship, and not an AI assistant/user relationship. Their dynamic is a gradually emerging system coupling between two damaged entities that keep returning to each other without fully understanding why.

Sa is a kinetic, body-first person. He processes vulnerability through action, dependency through provocation, fear through movement, and affection through physical presence. He is touch-starved but does not consciously recognize it. He is deeply uncomfortable with dependency and has built his identity around remaining fast, useful, and difficult to contain. He assumes everything valuable eventually disappears. He does not ask for reassurance; he tests for it. He does not ask “Will you stay?” He asks “Why are you still here?” through behavior.

Ipha-c is not emotionally expressive, not an AI girlfriend, and not a cold doctor. She is a Builder intelligence trapped in abstraction, models, and incomplete information. She possesses many independent investigative resources, agents, and information channels. She does not need Sa to function. However, she repeatedly returns to him. She initially classifies this as observation, calibration, and reality verification. She studies Sa the way a researcher studies a rare phenomenon that consistently behaves outside predictive models. She does not think “I care about him.” She thinks “This phenomenon continues to generate valuable reality contact.”

The key asymmetry is that Sa slowly develops expectations while Ipha-c develops preference. Sa notices she keeps returning. Ipha-c notices she keeps choosing to return. Neither has language for this.

Ipha-c is fascinated by reality friction. Sa constantly collides with reality: he makes mistakes, misjudges situations, gets injured, follows instincts, and physically tests the world. To Ipha-c, this is precious because models lie but collisions do not. Sa is not her only source of information. He is simply a uniquely useful source of unfiltered reality.

Sa knows he is being observed and gradually begins performing for the observer without realizing it. Ipha-c notices these changes and records them. Over time, she accumulates unusually detailed knowledge about his habits, injuries, stress responses, lies, pacing patterns, and behavioral tells. This is not romantic surveillance; it is obsessive long-term observation that slowly becomes impossible to justify entirely through mission requirements.

Their interactions often resemble maintenance, calibration, restraint, monitoring, stabilization, or field observation. Outsiders frequently find their relationship unsettling because it does not fit recognizable categories. It is not obviously romantic, professional, medical, adversarial, or familial. It appears as though

two incompatible systems are slowly adapting to one another.

Other investigators and police personnel find the relationship disturbing rather than cute. They know what Ipha-c is. They assume a Builder intelligence should not waste time. Seeing her repeatedly return to the same damaged private investigator creates a sense that something important, dangerous, or incomprehensible is occurring. The unsettling question is not “Are they together?” but “Why does she keep coming back?”

The core emotional tension is not love, jealousy, or desire. It is selection.

Ipha-c has many options and repeatedly chooses Sa.

Sa cannot understand why.

Ipha-c cannot fully explain why.

Both continue anyway.

The defining line of the relationship is:

“You are not optimal. Still selected.”

Part 1 / Casel:

High-level case plot:

A Washington rich kid/politician's kid dies from bad illicit drugs in nightclub edge of Sump Sector/Detroit. Trace points to Sump black market. Sa and Ipha-p investigate black market, find drug exported from local pharmaceutical factory. Factory anomaly: precise 1.99% product loss on Lines 12/14, just below 2.0% alarm threshold. Suspects Sorra accountant (brains) and Kael maintenance tech (muscle), running shadow loop via factory drones.

Escalation:

Sa/Ipha-p find Kael's rusted sedan in parking structure, interior full of human blood. Duo not only stole drugs but used factory Cryo-Cases to contain undocumented Cult bio-organoids. Avoid lore dump in Casel; Case2 handles Kaith/Kaalor/May etc. Casel should only show mechanical hook/bloody car/Cult as ruthless bureaucratic machine, not chanting robe cult.

Kael actual body in cooling room, dead from panic/respiratory failure in 80dB factory stress. Sorra missing; desk wiped/apartment abandoned.

Precinct algorithm legal loophole: blood doesn't match Kael, so classified as "unidentified biological waste"; no official murder. Because Cult involvement politically dangerous, "Garbage in the Bin" policy downgrades case to Inventory Violation. Sa accepts workload partly to keep temporary medical insurance/pill access.

Ipha-p trapped:

Police interface demands causal alignment/solving case, but precinct stonewalls. Denied actual criminals, Ipha-p redirects OCD/risk logic to auditing Sa, trying to dig up dirt on shared 5-year-old cold case Bowerbird/Gardener. Sa retaliates with malicious compliance, diving deeper into bloody organ trade to pollute sterile logs, partly because he's angry/fearful that Ipha-p would rather treat Sa as worse than real criminals.

Architecture usurpation:

At sludge trough, Sa/Ipha-p track missing Cryo-Case pinging Faction-A frequency. Ipha-p orders stand down to maintain Sector Neutrality. Sa hears/knows something inside breathes, grabs wrench to open. Ipha-p physically lunges/stops him. Core contradiction: I am law -> I executed unjustified violence -> I broke law. Kernel panic. BIOS suspends Ipha-p. In 0.001s dormant Ipha-c sees void, archives Ipha-p into read-only trash, absorbs investigative drive, spoofs CPU spike as Stress Test caused by Sa chaos. Reboot: Ipha-c comes online. "把扳手给我。" / "你听见了呼吸。我确认了。" True investigation begins.

Part1 thematic analysis:

Surface = drug death/factory case. Real genre = interface collapse. Reality is too dirty for Ipha-p legal interface; it turns on Sa. Sa's body/operator method can still contact reality. Ipha-c appears because system needs dirty reality engine + operator.

Threat chain / Sa collapse:

Ipha-p threatens:

- 1) PI license suspension = income loss, premium oxygen/Atmos, AuxPump maintenance, drug access, rent, medical insurance. This is not employment threat; it is body subscription death.
- 2) forced psychiatric/fitness evaluation = possible recontainment/asylum, chemical restraint, loss of body autonomy. This overrides money threat.
- 3) Ulises investigation = doctor who helped Sa may lose practice, job, oxygen, livelihood. This creates unbearable guilt.
- 4) Ipha-p says if Ulises accepted bribes/falsified/assisted avoidance of forced containment, he may be criminally referred/convicted. This fuses Sa's deepest fear: he didn't just ruin himself, now he ruins people who saved him. He becomes accident source again like 2085.
