

Ignore ISX Collision

Yes. The key thing to know: **collision filtering in Unreal is done by collision channels, not by tags**. Your "ISX" tag won't filter physics at all — tags only help *after* an overlap fires, inside Blueprint/code.

Since the ISX collision and the character capsule are **separate components on the same actor**, you can give them different collision settings. That's what makes this possible.

Cleanest way: custom Object Channel

1. **Make a new Object Channel**. Project Settings → Engine → Collision → New Object Channel... → name it `ISX`, default response Ignore (or Block, doesn't matter much).

Just search `Collision`

2. **On the ISX collision component** (in the character BP): set its **Collision** → **Object Type** = **ISX**.
3. **On the FixedCamera collision**: in its **Collision Responses**, set the **ISX** channel → **Ignore**. Leave the channel your character capsule uses (usually **Pawn**) → Block or Overlap, whatever you already have.

Now the fixed-cam collision reacts to the character capsule but completely ignores the ISX component, even though they're the same actor.

Quicker alternative (only if you use Overlap events)

If FixedCamera works via overlap events (not hard blocking), you can skip channels and just filter in Blueprint:

- On `OnComponentBeginOverlap`, check `Other Comp` → `Component Has Tag ("ISX")` → if true, return early.

This is less work but **doesn't work for physical blocking** — only for overlap logic. If you need the cam to physically not be pushed/blocked by ISX, use the channel method.

Which is it for your FixedCamera — does it **block** the character or just **overlap** to detect it? That decides which approach you need. If you tell me, or let me peek at the FixedCamera BP setup, I

can give exact steps.
