 image-20260529-191722.png

保险起见，需要在Scene里get的物体都建立variable然后去scene里吸

Update: Parent changed to VTGLMBase(by Claude)

 image-20260617-004935.png

Now every child (BPLM_BarBack, etc.) inherits the new stuff: `Get Active Stage`, the test-override checkboxes, and `OnStageBegin`.

Then add the event

In `BPLM_BarBack` (the per-map one):

- Right-click the graph → search `OnStageBegin` → add it (it shows under *Add Event*).
- It gives you a `Stage (Name)` output pin → **Switch on Name** → Chain A / Chain B.

Quick sanity check

- Reparent the **base** BPLM (so all maps inherit) — not each child.
- Put the actual `OnStageBegin` logic in the **child** (`BPLM_BarBack`), since the chains are per-map.
- The **test override** checkboxes (`Override Stage For Testing / Test Stage`) show on the **placed BPLM actor** in the level → Details panel.

Reparent BPLM, then `OnStageBegin` will be there. Tell me if the reparent throws any compile errors.
