

Event A, B, C

- If EventA triggers, trigger1 fires Event B, if EventA not triggered, trigger1 fire Event C
用Enum instead of bool

1. 建 Enum

Content Browser 右键：

```
Blueprints → Enumeration
```

命名：

```
E_EventB_State
```

打开它，建 3 个值：

```
BeforeA  
AfterA  
AfterB(?)
```

2. 在 BPLM 里建变量

变量名：

```
EventB_State
```

类型选：

```
E_EventB_State
```

默认值：

```
BeforeA
```

3. EventA 发生时

在 EventA 最后接：

```
Get BPLM
→ Set EventB_State = AfterA
```

就这一句。

4. Trigger 触发时

你的那个会触发 EventB/EventC 的 Trigger 里：

```
On Trigger
→ Get BPLM
→ Get EventB_State
→ Switch on E_EventB_State
```

然后这样接：

```
BeforeA → Play EventC

AfterA → Play EventB
        → Set EventB_State = AfterB
```
